

Diabetes Prioritisation map

This map is a decision support tool designed to determine priority of access for diabetes services. The map screens each referral to determine how quickly the person needs to be seen by allocating a risk rating. It is designed for use at Intake.

Clinical risk categories

Three risk categories have been identified: High, medium and low corresponding to priority 1, 2 and 3 respectively. For each risk category a response time from risk screening to assessment is indicated. Criteria used to determine each risk category is multi-disciplinary rather than discipline specific.
